

Integrity Dashboards for Project Management

Project Basics

A manufacturing company designed a new requirements management system. Once the data was added, there was a need to quickly and easily access the data and view meta data for project management purposes.

Tools

PTC Integrity Dashboards

- Queries
- Reports
- Charts

- 5 Dashboards
- 30 queries
- 97 charts
- 4 Reports

Problem

Requirement and verification data are being migrated to and stored in an unfamiliar tool. As a result, users are losing valuable time fetching and interpreting data.

Solution

Create a quick launch dashboard that provides users with queries, charts and reports. The queries allow users to quickly drill down to the data they need. The charts allow users to visually see the reported data.

Benefits

- Dashboards allow product management to quickly address issues using an easy-to-navigate tool.
- Provides a way to focus improvement work by giving a role-based reporting view of areas that need to be addressed.
- Provide a more graphical / visual view of the structured data in the requirements management tool without having to be an expert in the tool itself.
